Towards a spatial analysis of shooting in Philippine basketball

Applications in the University Athletics Association of the Philippines (Season 81)

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

What do I want to accomplish?

- Find court divisions empirically using the field goal dataset.
- Find similar players based on their shooting habits at different areas on the court.
- Compute for spatially-aware shooting metrics for comparing and analysing shooting performance.

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

What do I need?

- Field goal dataset with location.

The problem? No such dataset exists for the Philippines (that is easily downloadable).

The solution? Build a scraper of FIBA LiveStats data.

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

Finding “shot types” or “shooting zones”

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

What could I do?

- Clustering algorithms
 - K-means
- Matrix decomposition algorithms
 - PCA
 - SVD
 - NMF

openness. data. geospatial.

@bnhr.xyz

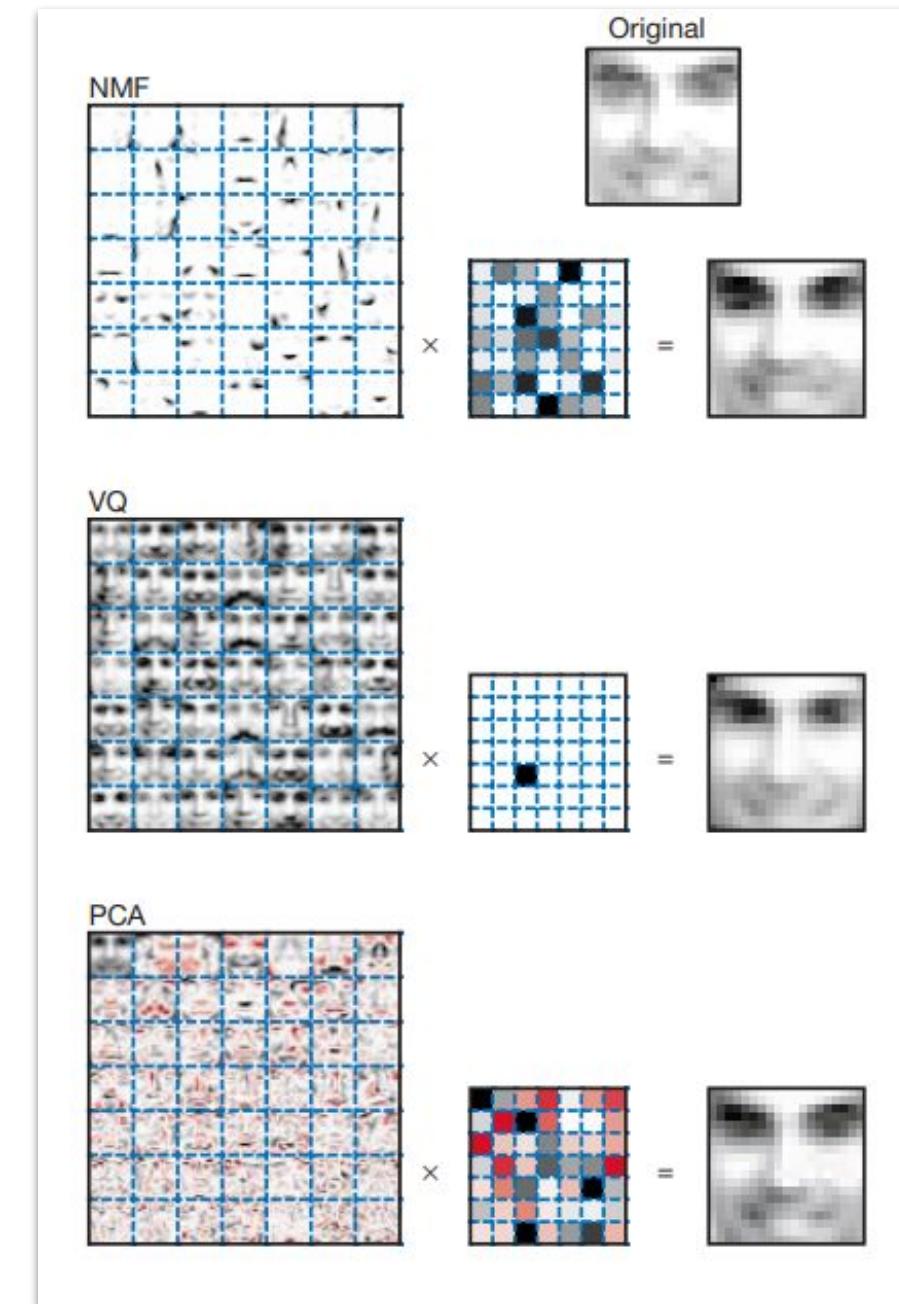

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

NMF or Non-negative Matrix Factorization

- $V = WH$
 - V , W , and H are **non-negative** and W, H are lower rank than V
 - Resulting components exhibit a **“parts-based” decomposition** of the original matrix
 - Sparser and more interpretable (i.e. they correspond to **frequently occurring patterns** in the sample)
 - Useful in learning **parts of objects**

Basis vectors for faces using NMF, VQ, and PCA (Lee & Seung, 1999)

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

NMF makes sense for basketball

Why it makes sense:

1. the intensity surface of **field goals** is **always non-negative** because you can't take negative number of field goals in a location
2. the output matrices of the decomposition intuitively correspond to basketball concepts:
 - a. **H - represents shooting zones / areas**
 - b. **W - represents shooting tendency / frequency**

How it's done:

1. **Discretize the basketball court** using a regular tessellation (shooting cells)
2. For each player, **fit an intensity surface** of his field goals on the discretized court
3. **Generate the field goal matrix V** using the intensity surfaces of the players
 - a. **Each row** of the matrix is an **array of a player's intensity surface**
 - b. **Each column** in the player array corresponds to **one shooting cell**
4. Use NMF to find W, H such that $\mathbf{V} \sim \mathbf{WH}$.

openness. data. geospatial.

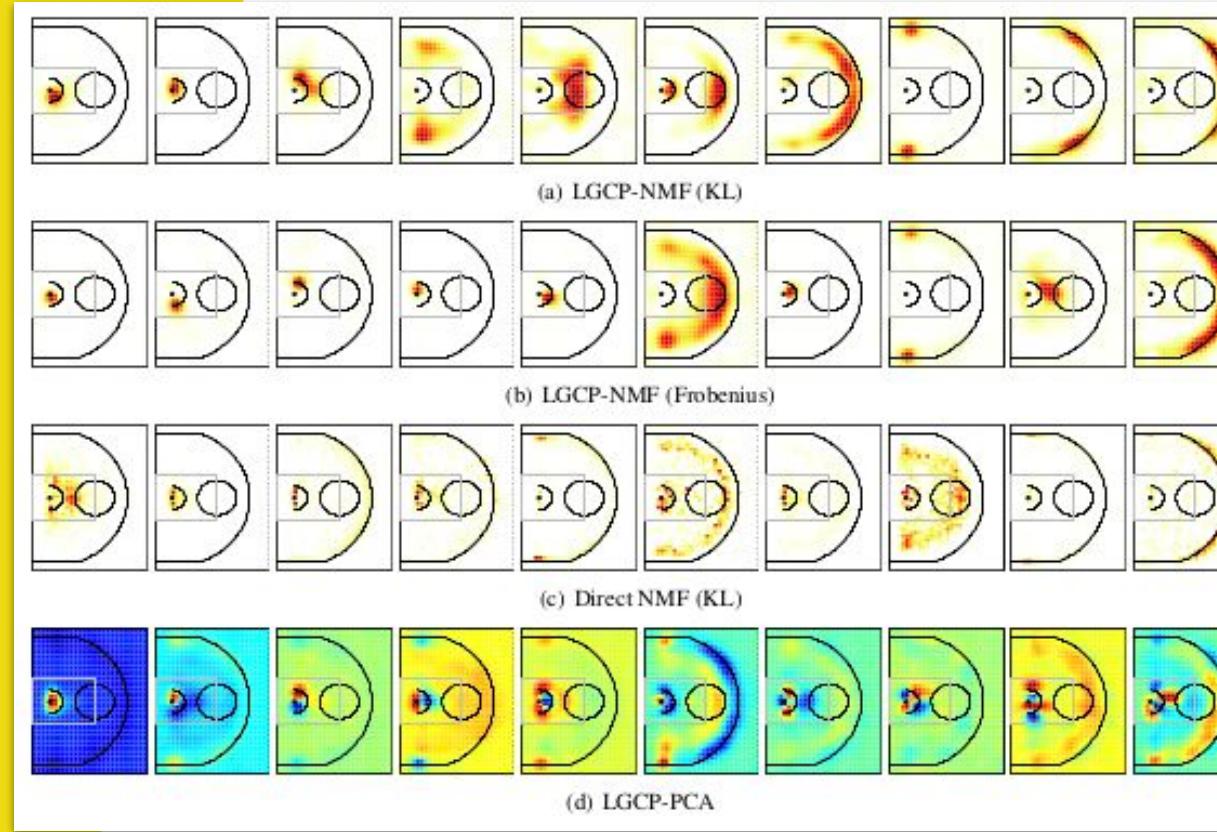

@bnhr.xyz

@BNHRdotXYZ

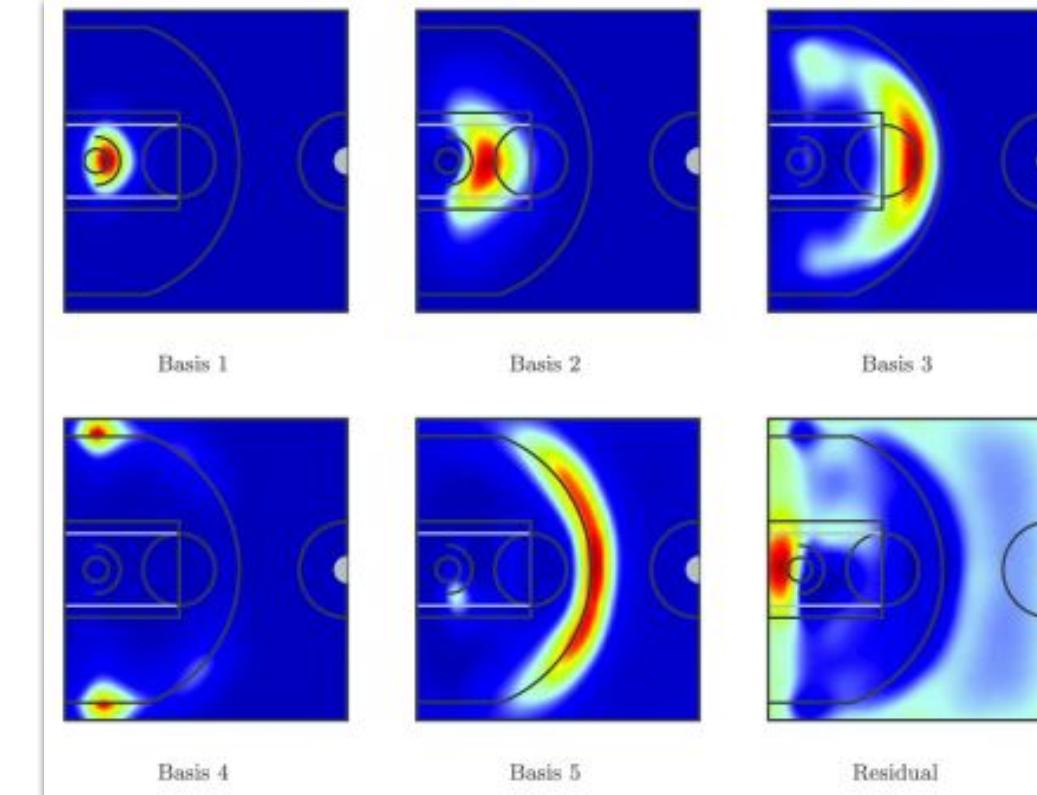

BNHRdotXYZ

<https://bnhr.xyz>

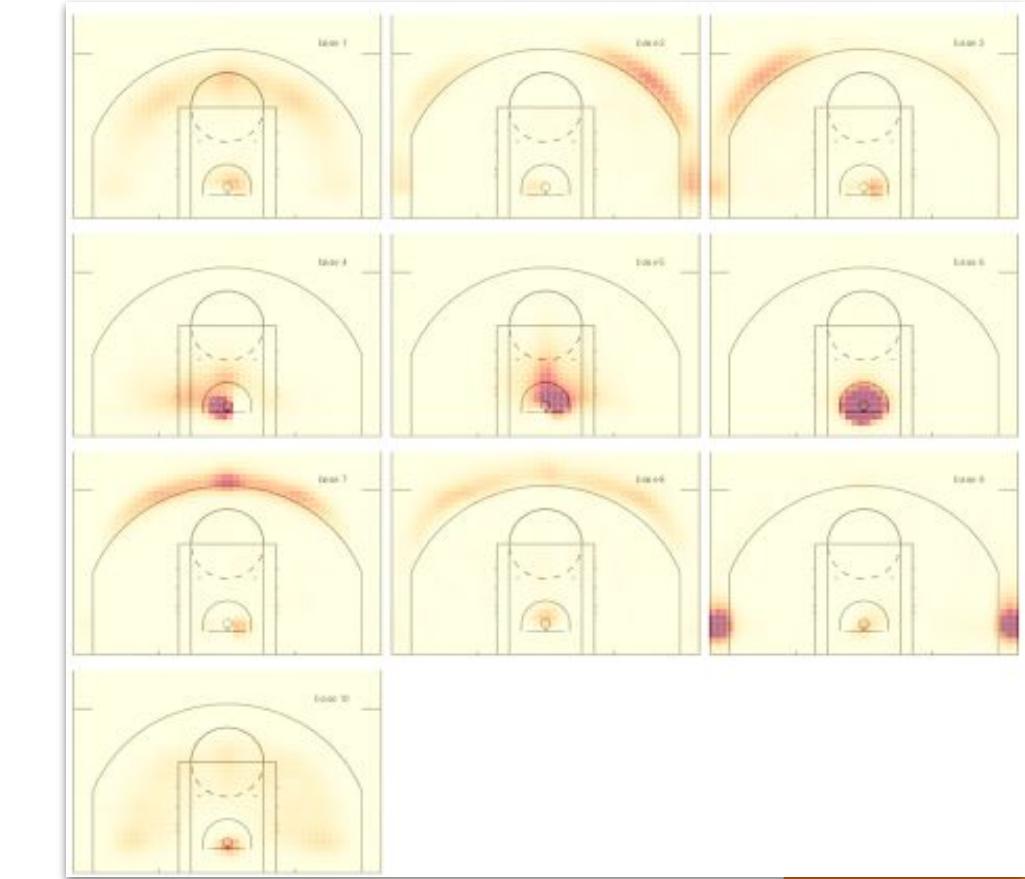

NMF makes sense for basketball

Spatial basis vectors of field goals using LGCP-NMF with $B=10$ using the Kullback-Leibler (KL), Frobenius loss, direct NMF, and LGCP-PCA. (Miller, 2014)

Spatial basis vectors identified by LGCP-NMF for $B=6$. (Franks, 2015)

Spatial basis vectors of field goals using kernel estimation and NMF (Jiao, 2020)

openness. data. geospatial.

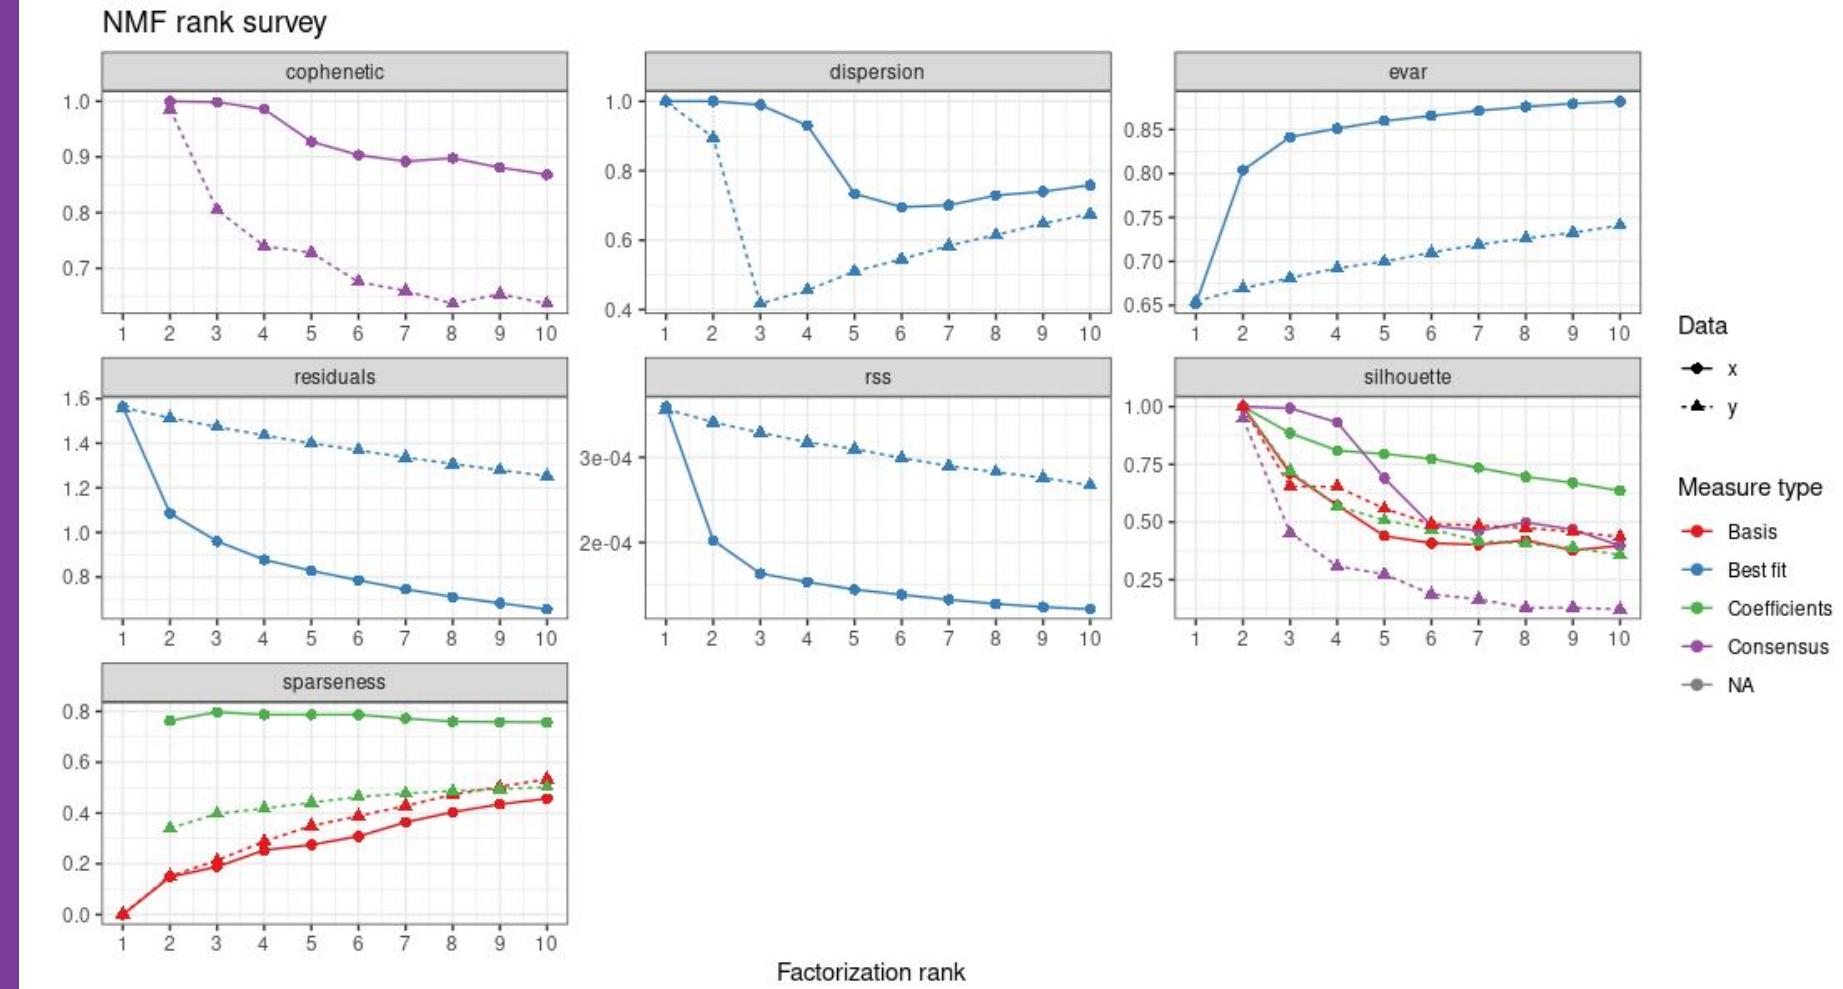

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

Finding the optimal rank (number of basis)

Three methods for estimating the optimal value of K (number of basis) for NMF from the application of NMF on omic (e.g. genomic) data by looking at different NMF rank measures

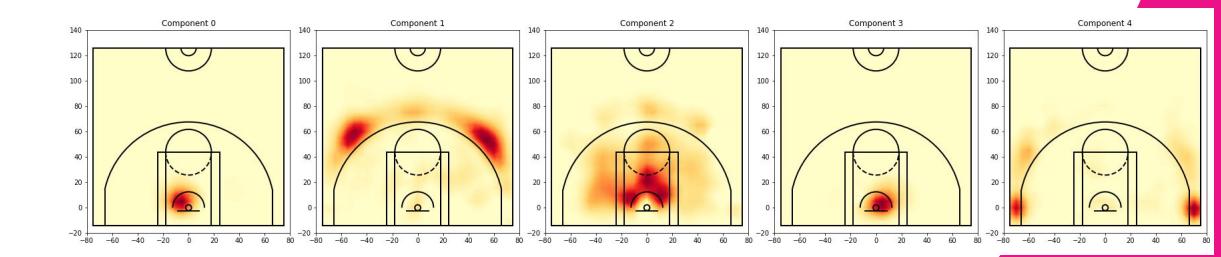

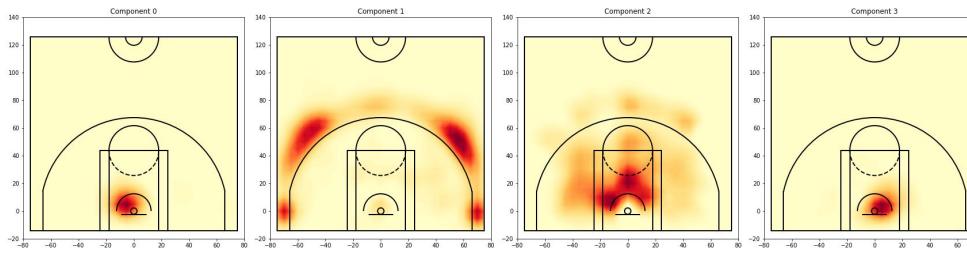

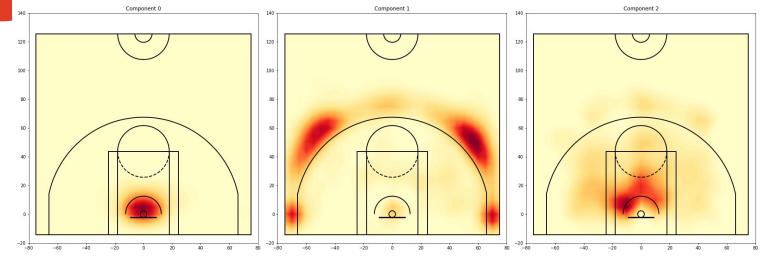

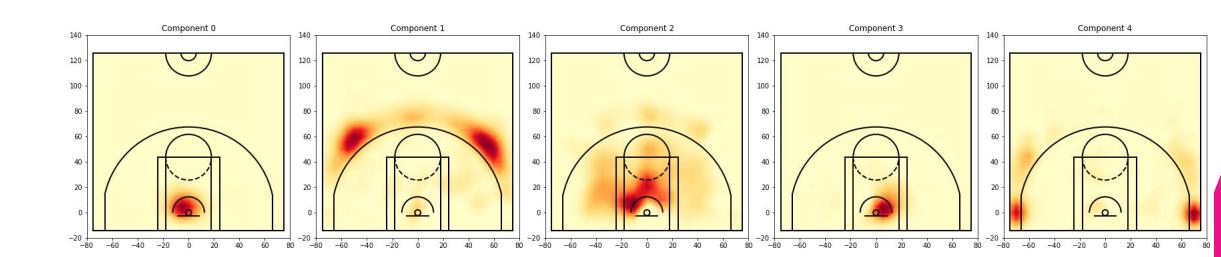

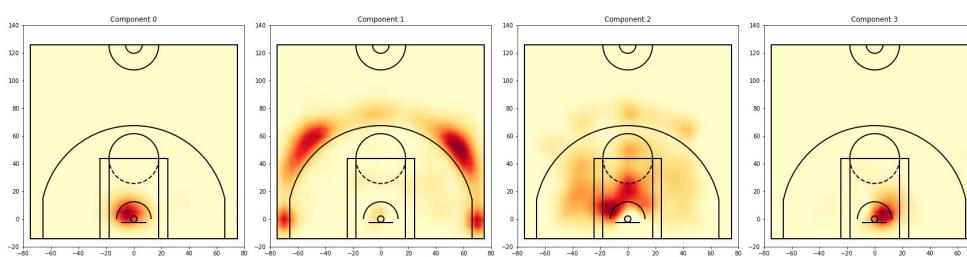

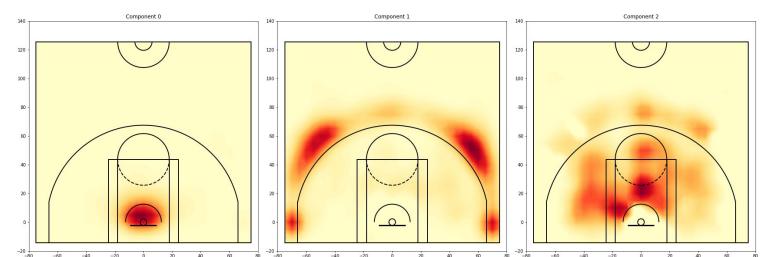

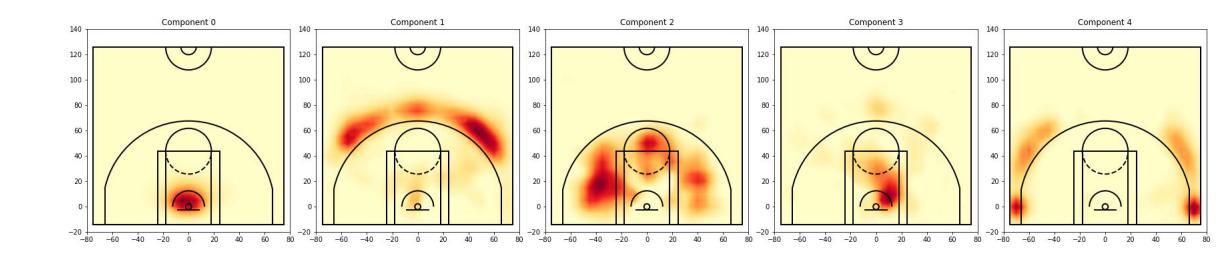

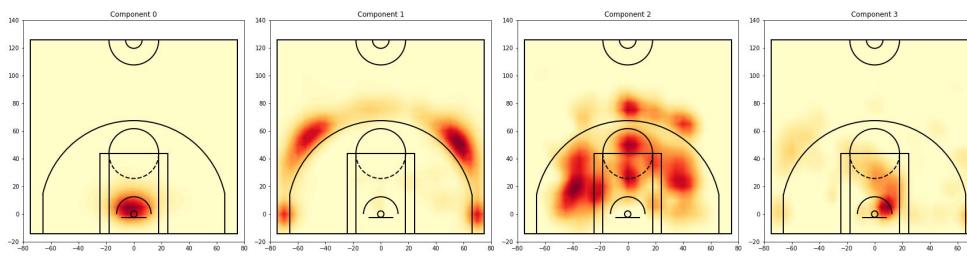

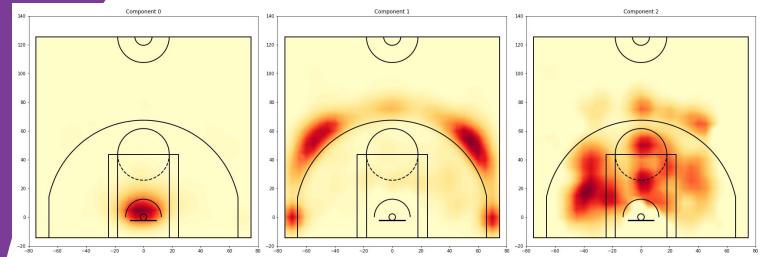

- Brunet (2004) - the first value of K for which the cophenetic coefficient starts decreasing
- Hutchins (2008) - the first inflection point of the residual sum of squares (rss) curve
- Frigyesi (2008) - the smallest value of K where the decrease in RSS computed from the actual data is lower than the decrease in RSS computed from random/permuted data

Based on the graphs and rank measures, the optimal number of bases in the field goal dataset is **between 3-5**.

openness. data. geospatial.

Finding similar players

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

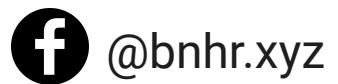

<https://bnhr.xyz>

What I did...

- Players with similar shooting habits were determined by computing the Euclidean distance of the player basis weights.
- Using this distance, a player's five nearest neighbors were identified.
- If player k is the neighbor of player l, it is assumed that player l is also a neighbor of player k to enforce symmetry.

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

What I found...

Similarity of player shooting habits across the league (UAAP S81)

The number of neighbors indicate the number of players around the league with similar shooting habits as the player. The average distance indicates how similar the player is to his neighbors (shorter distance = more similar).

Chart: BNHR • Source: BNHR • Created with Datawrapper

Two groups of players that are interesting.

- Group of players with **average distance near or less than 0.1**. This indicates that they have **very similar shooting habits to their neighbors**. What's characteristic of these players is that **they almost exclusively take shots from near the basket**. Players from this group include P. Orizu, B. Ebona, S. Akomo, and B. Akhuetie.
- Second group are those whose **average distance to their neighbors is greater than 0.3**. All the players that belong to this group only have five to six neighbors each. This combination of low number of neighbors and long distance between them and their neighbors could indicate that the players belonging to this group have **uncommon shooting habits relative to the rest of the league**. The players in this group are G. Mamuyac, J. Pingoy, F. Jaboneta, and T. Tio.

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

What I found...

Similarity of player shooting habits per team (UAAP S81)

The average distance indicates how similar a player's shooting habits are to his teammates (shorter distance = more similar).
The size of indicates the number of field goal attempts.

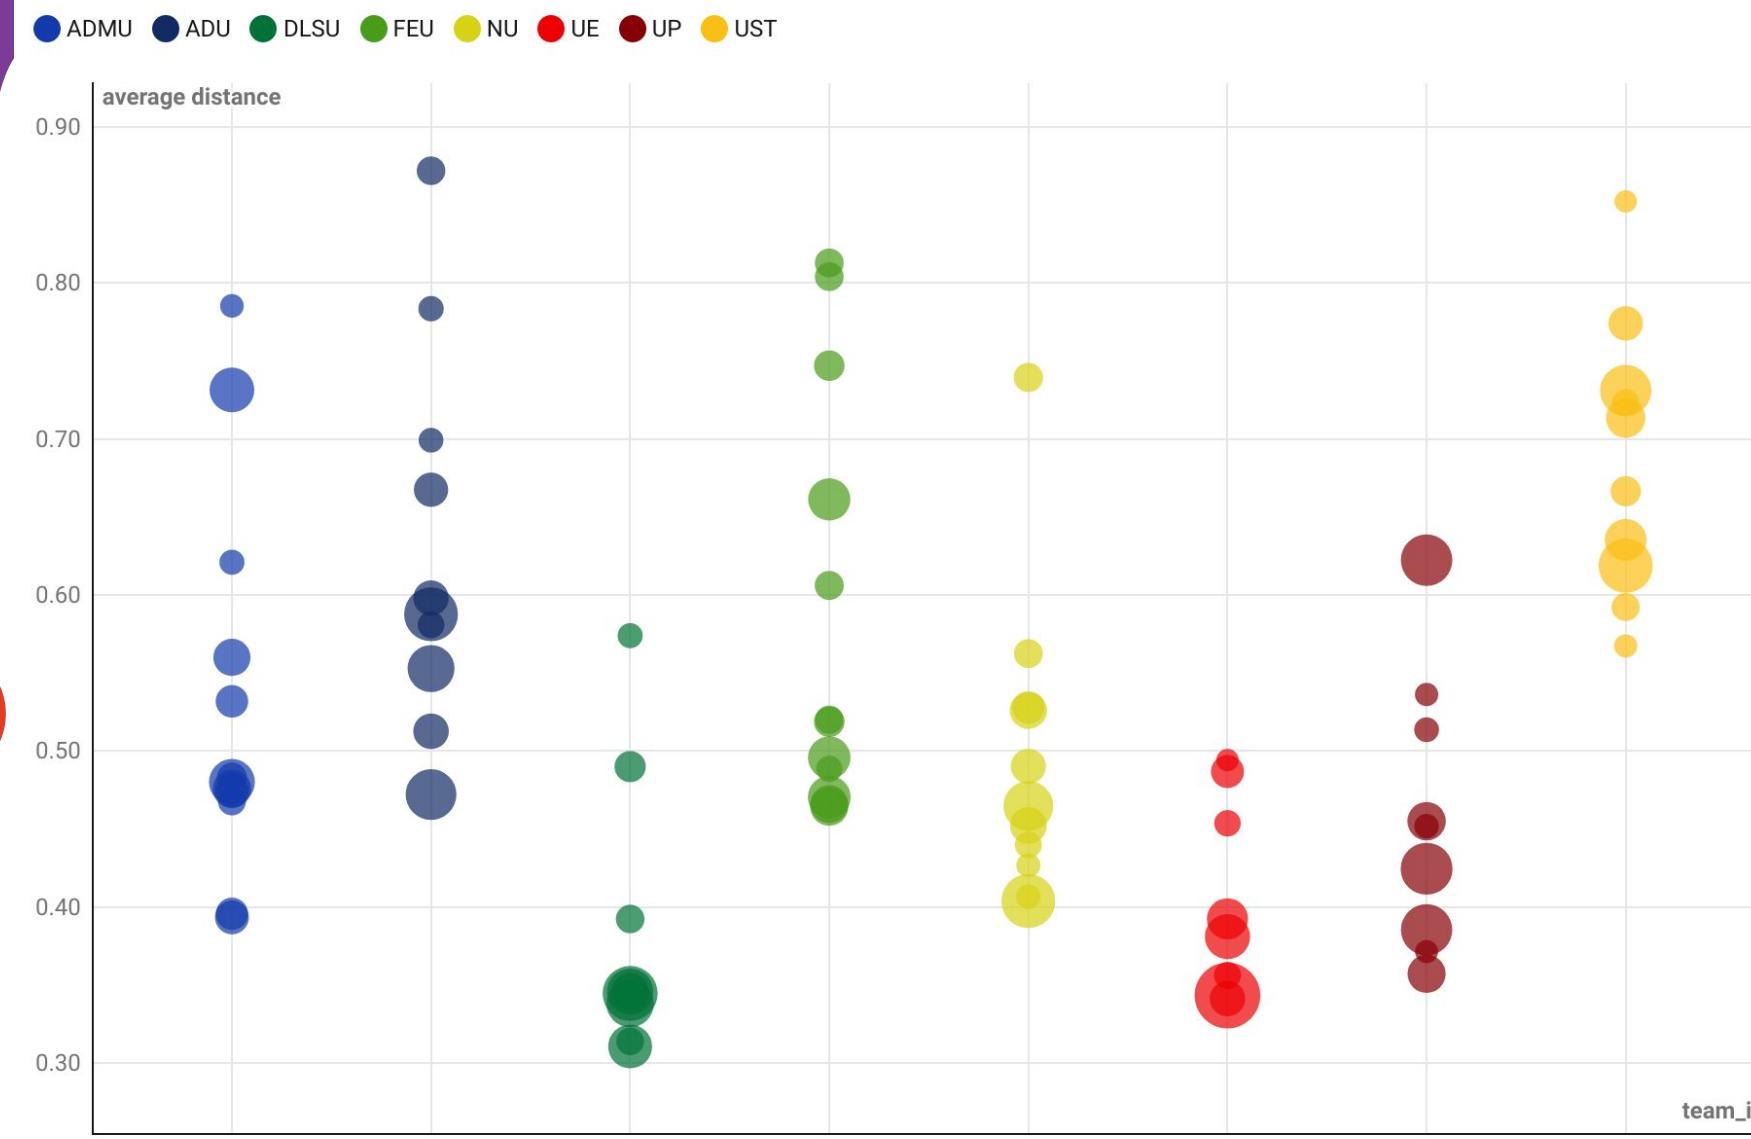

Chart: BNHR • Source: BNHR • Created with Datawrapper

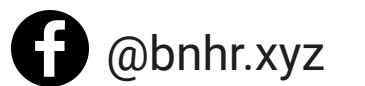

UE Red Warriors and DLSU Green Archers

- In the case of both teams, the distances between the shooting habits of their players with the rest of their teammates are small which means that their players have similar shooting habits and can indicate that both teams run a predictable offense regardless of the combination of players on the court.
- For both teams, the players with the most field goal attempts are also those with the most similar shooting habits to the rest of their team indicated by the large circles at the lower end of their graphs.

In contrast, the other teams have a significantly larger range of values in terms of the similarities in the shooting habits of their players.

openness. data. geospatial.

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

Spatially-aware shooting metrics

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

Better model of scoring ability

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

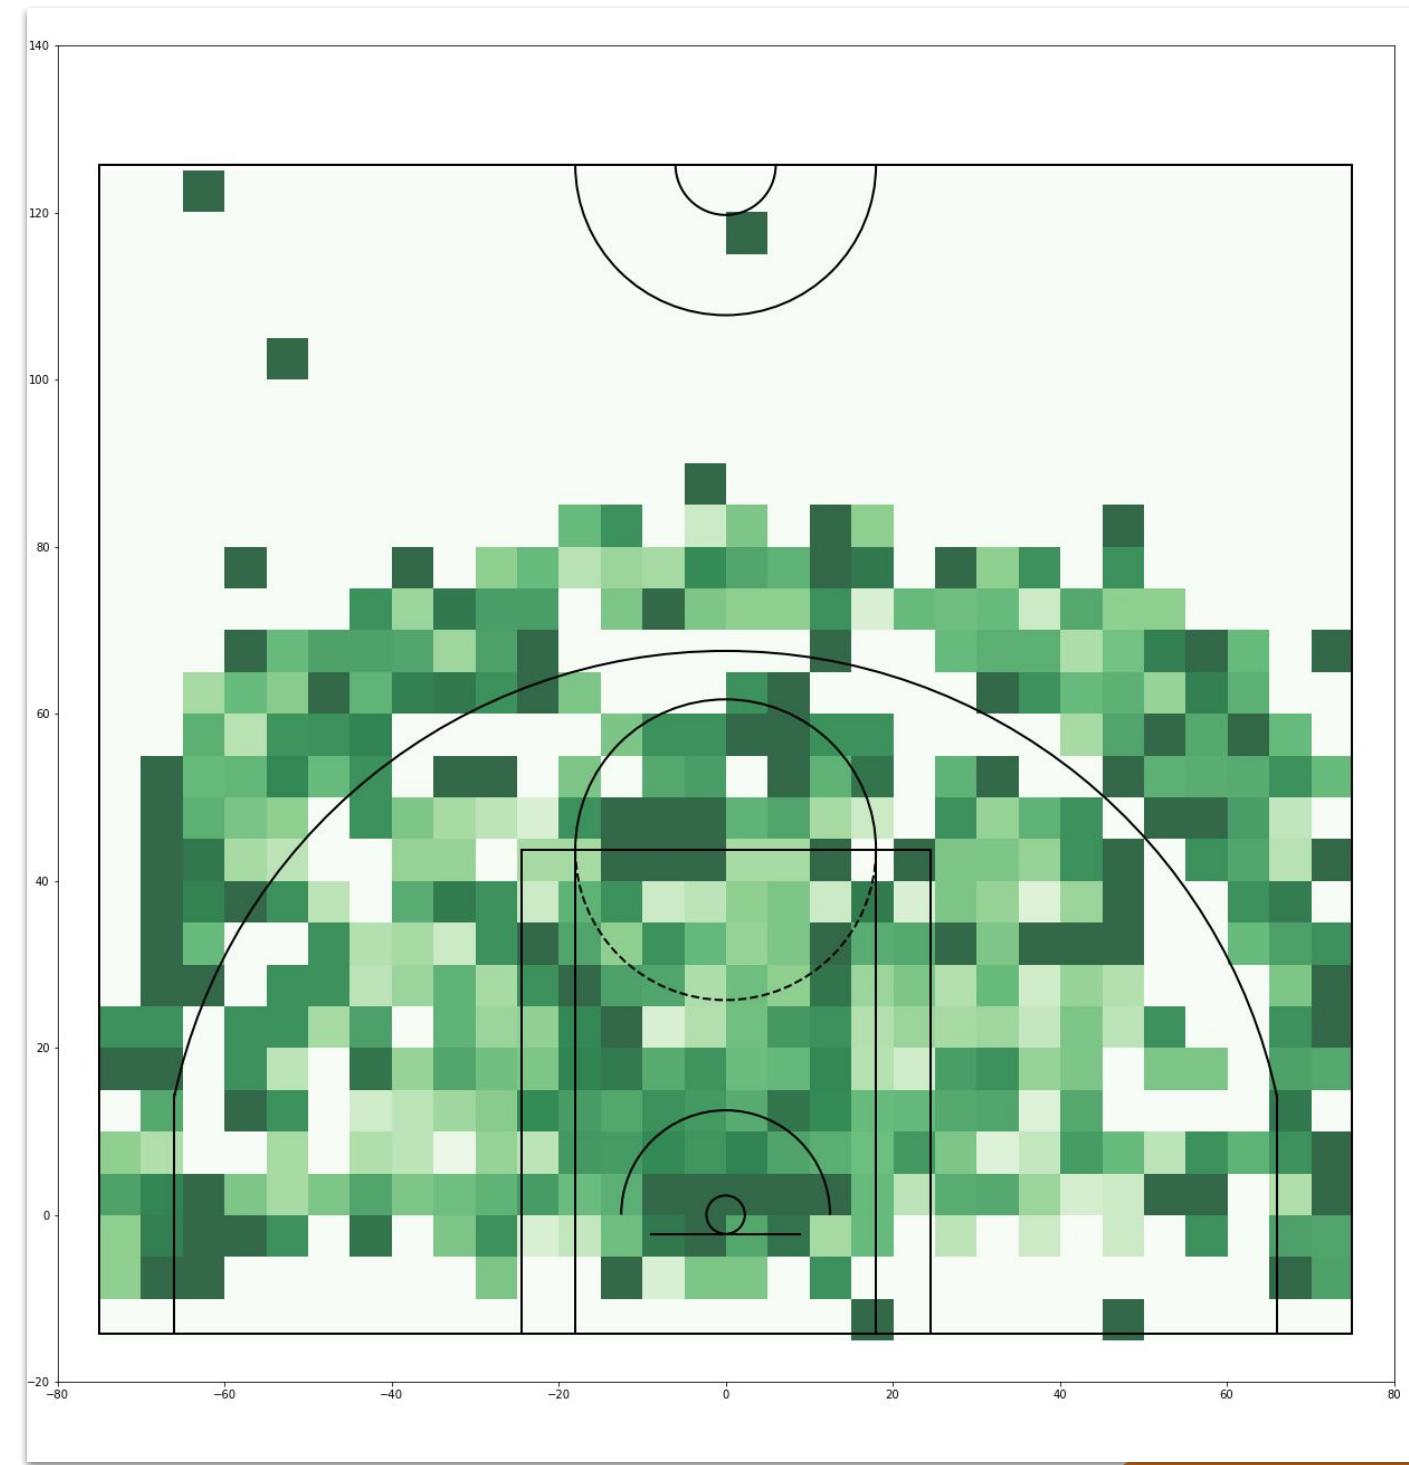

BNHRdotXYZ

<https://bnhr.xyz>

What's the problem?

1. Divide the court into 50cmx50cm cells.
2. Not all cells on the court have field goal attempts.
3. Some cells have low field goal attempts that may not properly indicate the actual scoring rate at that location.
4. This results in a peppered and noisy Points Per Attempt map.

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

What's the solution?

1. Compute for the Empirical Bayes estimate of PPA at each cell.
2. Prior distribution at cell i includes:
 - a. nearby cells within distance j from cell n
 - b. cells that are equidistant (within k from distance d) to the basket
 - c. increasing values of j and k for cells beyond 7 meters from the basket

$$PPA_i = \frac{PTS_i}{FGA_i} \quad (1)$$

Points Per Attempt

PTS = points scored at cell i

FGA = number of FG at cell i

$$\hat{\gamma}_i = \frac{\sum PTS_j}{\sum FGA_j} \quad (2)$$

prior mean for cell i

j are the cells in the local neighborhood

$$\hat{\varphi}_i = \frac{\sum n_j(p_j - \hat{\gamma}_j)^2}{2} - \frac{\hat{\gamma}_i}{n_j} \quad (3)$$

prior variance

n_j is the number of shots taken in cell j, p_j is the raw PPA observed in cell j, and \bar{n}_j is the sample mean of the number of shots taken within all neighborhood cells j

$$\hat{W}_i = \frac{\hat{\varphi}_i}{\hat{\varphi}_i + \hat{\gamma}_i/n_i} \quad (4)$$

weighting factor

n_i is the number of shot attempts from i

$$\hat{\theta}_i = \hat{W}_i p_i + (1 - \hat{W}_i) \hat{\gamma}_i \quad (5)$$

Empirical Bayes estimate of the PPA

weighted combination of the local raw PPA p_i and the Bayesian local average $\hat{\gamma}_i$

What's next?

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

Spatial Scoring Effectiveness (SScE)

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

Spatial Scoring Effectiveness (SScE)

1. Similar to the Spatial Shooting Effectiveness metric introduced by Shortridge (2014).
2. A measure of scoring effectiveness based on the spatial distribution of field goals defined as the difference between the player's points per attempt (PPA) and his expected points per attempt (EPPA) based on the EB-estimated PPA.

openness. data. geospatial.

 @bnhr.xyz

 @BNHRdotXYZ

 BNHRdotXYZ

 <https://bnhr.xyz>

Spatial Scoring Effectiveness (SScE)

1. Get a player's field goal locations.
2. Compute for the player's Expected Points Per Attempt (EPPA) based on his field goal locations and the EB-estimate PPA at each location.
 - a. *EPPA can be used as a summary metric indicating if a player takes shots from areas that are easy or difficult to score (low EPPA = difficult shots).*
3. Compute for the player's actual PPA.
 - a. for Global SScE: total PPA
 - b. for local SScE: PPA per cell/location
4. **SScE = PPA - EPPA; local SScE = PPA at cell - EPPA at cell**

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

Spatial Scoring Effectiveness (SScE)

Global SScE

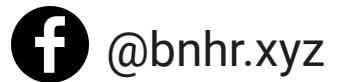

- Positive values indicate players are scoring more than expected while negative values indicate the opposite.

Local SScE

- SScE computed per cell/location
- Can be mapped to show the spatial distribution of a player's SScE—i.e. **at what areas on the court is a player scoring more or less than expected.**

openness. data. geospatial.

@bnhr.xyz

BNHRdotXYZ

<https://bnhr.xyz>

Points Relative to League Average (PRLA)

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

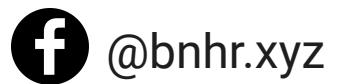

<https://bnhr.xyz>

Points Relative to League Average (PRLA)

1. Similar to the Points Over League Average metric introduced by Shortridge (2014).
2. A measure of scoring effectiveness based on the spatial distribution of field goals defined as the difference between the player's total points scored (PTS) and expected points (EPTS) based on the EB-estimated PPA.

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

Points Relative to League Average (PRLA)

1. Get a player's field goal locations.
2. Compute for the player's Expected Points (EPTS) which is the sum of his Expected Local Points (ELPTS) based on his field goal locations and the EB-estimate PPA at each location.
3. Compute for the player's actual PTS scored.
 - a. for Global SScE: total PTS scored
 - b. for local SScE: PTS per cell/location
4. **PRLA = PTS - EPTS; local PRLA = PTS at cell - ELPTS at cell**

openness. data. geospatial.

 @bnhr.xyz

 @BNHRdotXYZ

 BNHRdotXYZ

 <https://bnhr.xyz>

Points Relative to League Average (PRLA)

Global PRLA

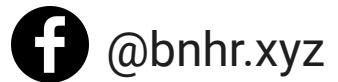

- Positive values indicate players are scoring more than expected while negative values indicate the opposite.

Local PRLA

- PRLA computed per cell/location
- Can be mapped to show the spatial distribution of a player's PRLA—i.e. **at what areas on the court is a player scoring more or less than expected.**

openness. data. geospatial.

@bnhr.xyz

@BNHRdotXYZ

BNHRdotXYZ

<https://bnhr.xyz>

What else?

- Comparison of teams and players using SScE and PRLA.
- Comparison of SScE and PRLA with conventional shooting metrics.
- Sniff test with fans, players, coaches, teams, etc.
